

FOOD WASTE PLANET

Food waste makes the Earth's temperature go up, which can cause problems like extreme weather

To grow food, we need water. When we waste food, it's like wasting all the water used to grow that food

When the Earth's temperature goes up, it causes rising sea levels as Glaciers melt - this can leave Polar Bears with less of their natural habitat

The food & drink industry uses 70% of all daily fresh water withdrawals around the world.

Approximately 8-10% of the world's greenhouse gas emissions relate to food waste.

If food waste were a country, it would be the third biggest emitter of greenhouse gases, behind the US and China.
